1. LAM01 3300-1650

By using an innovative solution with the drawer structure, we can laminate several layers of glass while placing glass on the spacer up to a height of 100 mm, which also increases the furnace efficiency by eliminating subsequent drawers, they are unnecessary thanks to the very good furnace thermometer, the maximum temperature difference in the furnace is 2 degrees C. The furnace can be extended by further heating chambers or drawers up or sideways.

1.1. TECHNICAL DESCRIPTION

- * **frame:** steel, painted
- * **insulation:** light panels filled with insulating mineral wool and 15 mm glass wool pressed insulation panels resistant to a temperature of 1250 degrees C
- * **heating:** infrared heaters placed in radiators tubular (very economical heating and stable heating temperature innovation)
- * **temperature measurement:::** thermocouples in each heating zone connected to the controller and computer showing the heating curve of each production process and archiving these processes on a computer disk innovation
- * **working surface:** movable - on trolleys with a lift hydraulic
- * **vacuum space:** silicone bag (for flat glass with a special lock) a new solution with additional vacuum protection
- * **vacuum generation:** vacuum pump - located in an easily accessible place 18 mc / h from DVP

Max. working dimensions of the glass: 3300x1650 mm - 1 pec.

- * **max. height of bent glass:** 150 mm.

- * **vacuum measurement:** vacuum gauge

- * **control:** Bentrup TC-505 three IR heating zones

- * **installed power / power supply:** 16 kW 380V / 50Hz, 3ph + N + T.

- * **safety:** thermocouples and heaters controlled automatically with overheating protection. The chamber is divided into heating zones controlled from the PLC level
